**Overview:** Write a Python program to index words from a collection of short stories and then provide an interface to allow users to conduct short Boolean text queries to find stories that match their search.

**Learning objectives:** Gain experience processing text files, building indexes using Python dictionaries, and using regular expressions.

**Project specification:**
For this project, you will build an index of words in a collection of short stories. Specifically, we will index the Project Gutenberg text of Grimms' Fairy Tales, by The Brothers Grimm. I have posted a single text file called grimms.txt on the course web site that contains the text of all the stories. Use this file for the project. You do not need to index text from any other Project Gutenberg text

The grimms.txt file contains 63 short stories (fairy tales) in a single text file. When processing the file, you should skip over the introductory sections that have information about Project Gutenberg and the table of contents. Each fairy tale starts with a blank line followed by the title of the story in all capital letters on a line by itself, followed by another blank line. After this the text of the story begins. One of the stories, "The Adventures of Chanticleer and the Partlet," has two parts. Treat both parts as belonging to one story.

*Building the Index*
Your program should read the grimms.txt file, and create an index of all the words that appear in the fairy tales except for those in a provided *stopword* list. For this assignment, when building the index, you should REMOVE all characters that are not a letter, number, or space character (e.g., [a-zA-Z0-9 ]). In addition, when building the index, you should convert all words to lower-case. You will need to make the same conversions to queries that are entered so that they will match words as you have indexed them.

I have posted a file named stopwords.txt on the course web site that contains a list of words[1] (one per line) that should NOT be included in your index. As you are building your index, if you encounter a word in the list of the stopwords, you should skip it.

Do NOT index words that appear outside the text of the fairy tales (e.g., in the Project Guttenberg sections that appear at the beginning and end of the file, and the table of contents). For each word that you include in your index, you should keep track of the stories and line numbers that contain the word. For example, the word "raven" appears in three stories, on the lines show below. Note that the line numbers refer to line numbers in the grimms.txt file, starting from line 1 at the top of the file.

> THE LITTLE PEASANT : [3894 , 3924 , 3933 , 3936 , 3939 ]
> THE RAVEN : [6765 , 6767 , 6772 , 6773 , 6785 , 6802 , 6807 , 6820 , 6823 , 6839]
> SNOWDROP : [4501]

*User Interface*
After building the index, your program should provide a text-based user interface that that: 1) prompts the user to enter a Boolean search query, 2) returns a list of stories (and other information as outlined below) that match the query, and 3) goes back to (1) to let the user enter a new search query. If the user searches for the string "qquit" (with two qs), then the program should exit. You can use the Python 2.7 raw_input() command to get input from the user.

*Boolean query syntax*
At a minimum, your program should support the following types of queries:

---

[1] The stoplist we are using is adapted from: http://jmlr.org/papers/volume5/lewis04a/a11-smart-stop-list/english.stop, filtered to remove words with >=5 chars and with apostrophes.

| word1 | return stories the contain *word1* |
|---|---|
| word1 word2 | return stories that contain both *word1* and *word2* |
| word1 word2 .. wordn | return stories that contain all the words *word1* through *wordn* |
| word1 and word2 | return stories that contain both *word1* and *word2* |
| word1 or word2 | return stories that contain either *word1* or *word2* |

*Output*

In response to a query, your program should return information about the query and results as shown below.  First, print "query = " and the query string.  Then, for each story that matches the query, print the title of the story and a list of all the lines that contain the query string.  Use at least two spaces of indentation to improve readability as shown below.  You should also highlight the word that was matched on the line by surrounding it with two asterisks and displaying the word in all capital letters.

```
Please enter your query: owl

query =  owl
     JORINDA AND JORINDEL
       542 an **OWL**, or crept about the country like a cat; but at night she always
       581 with a mournful _jug, jug_. An **OWL** with fiery eyes flew three times
       588 the gloomy night came; the **OWL** flew into a bush; and a moment after the
     SNOWDROP
      4501 an **OWL**, and then a raven, and at last a dove, and sat by her side.
```

For queries that have no matching stories, you should print "--" as shown below.

```
Please enter your query: python

query =  python
      --
```

For queries that involve multiple words, for each story that matches the query, you should print results for each word as shown below.  Use at least two spaces of indentation to improve readability as shown below.

```
Please enter your query: owl and raven

query =  owl and raven
     SNOWDROP
       owl
        4501 an **OWL**, and then a raven, and at last a dove, and sat by her side.
       raven
        4501 an owl, and then a **RAVEN**, and at last a dove, and sat by her side.
```

For words in a an "or" query that do not occur in a story, you should print "--" as shown below.

```
query =  owl or raven
     JORINDA AND JORINDEL
       owl
        542 an **OWL**, or crept about the country like a cat; but at night she always
        581 with a mournful _jug, jug_. An **OWL** with fiery eyes flew three times
        588 the gloomy night came; the **OWL** flew into a bush; and a moment after the
       raven
        --
```

I have included a larger set of example queries and output at the end of this assignment document.

**Advanced queries**

If you implement the program as outlined so far, you can earn up to a maximum of 92 out of 100 points.  You can earn additional points for implementing two additional features:

1. (4 points)  Add a query keyword "near" that will allow users to enter queries that will search for two words that occur within plus or minus 1 line of each other in a story.  For example, "owl near raven" would match stories in which the word owl appeared either on the same line as raven, or one line above or below it.

2. (4 points) Add a query keyword "morethan" that will allow searches that require the word to the left to appear more than a specified number of times. On the right, the user should be able to specify either another word, or a number. For example, "owl morethan 5" should return stories in which the word owl appears more than 5 times, and "owl morethan raven" should return stories in which the word owl appears more times than the word raven.

**Grading:**
Your program will be evaluated based on its functionality, programming logic, and programming style. Functionality focuses on the question, "Does your program product the correct results?" Programming logic considers whether the approach you implemented in your code is correct (or close to correct). Programming style looks at how easy it is to understand your code – is it organized well, did you use functions appropriately, did you include good comments?

**How to turn in your assignment:**
Your program should be contained in a single file and be entirely code that you write yourself. Name your file according to the following convention:

```
youronyen_p1.py
```

Replace *youronyen* with your actual Onyen (e.g. my assignment would be `rcapra_p1.py`). The character between *youronyen* and the "p1.py" part should be a single underscore. There should be no spaces or other characters in the filename. Files with names that do not follow this convention may receive a substantial grade deduction.

I will test your program by running it with Python 2.7, with the files `grimms.txt` and `stopwords.txt` in the same directory.

Submit your file electronically through the Sakai by going to the Assignments area and finding the "P1" assignment. After you think you have submitted the assignment, I strongly recommend checking to be sure the file was uploaded correctly by clicking on it from within Sakai. Keep in mind that if I cannot access your file, I cannot grade it.

If for some reason you need to re-submit your file, you must add a version number to your filename. Sakai is configured so that it will accept up to 3 total submissions. Use the following file naming convention if you need to re-submit:

| | |
|---|---|
| Your first submission: | `youronyen_p1.py` |
| Your second submission: | `youronyen_p1_v2.py` |
| Your third submission: | `youronyen_p1_v3.py` |

Sakai is also configured with a due date and an "accept until" date. Submissions received after the due date (even just 1 minute!) will receive a 10% penalty per day. The "accept until" date is 5 days after the due date. Unless you have made arrangements with me in advance, submissions will not be accepted after the "accept until" date and will have a score of zero recorded.

**Example Program Run**

```
Python 2.7.6 (default, Nov 10 2013, 19:24:18) [MSC v.1500 32 bit (Intel)] on win32
